

ADCAMAT PRESSURE OPERATED PUMP POPS

DESCRIPTION

The ADCAMAT POP (Pressure Operated Pump) fabricated in carbon steel (stainless steel on request) is recommended in the transfer of high temperature liquids such as condensate, oils and others, to a higher elevation or pressure.

Under certain conditions, it can drain a closed vessel under vacuum or pressure.

The pump can be operated by steam, compressed air or other gases, and can be used for lifting any kind of non-corrosive liquids.

OPERATION

Liquid flows by gravity into the pump through an inlet check valve lifting a float which, at the upper limit of its stroke, opens the supply valve, allowing steam or compressed air to enter the pump's body. Pressure in the pump builds up until it's just sufficient to overcome back pressure.

The pressurized liquid opens the outlet check valve and discharge begins. When the float reaches the minimum lower level, it closes the steam or compressed air supply valve and opens the vent, allowing the liquid to fill the pump again. As the amount of liquid discharged after each cycle is known, the total volume that flows during a given period of time can be calculated by counting the number of cycles during that period. For that purpose, a special counter is available which screws into a tapped connection on the top cover of the pump. This counter records the number of pumping strokes, thus enabling the pump to function as a reliable flow meter.

MAIN FEATURES: No electric requirements.

OPTIONS: Stainless steel construction.
Level gauge.
Stroke counter.

USE: To lift hot condensate or other liquids.

AVAILABLE MODELS: ADCAMAT POPS - Carbon steel construction.
ADCAMAT POPSS - Stainless steel construction.
(Carbon steel version is sandblasted, metalized and black painted).

SIZES: DN 25 ; DN 40 ; DN 50 ; DN 80 x 50.

CONNECTIONS: Flanged EN1092-1 PN16.
Female screwed ISO 7/1 Rp (BS21) (Threaded flanges).
Others on request.

INSTALLATION: Horizontal installation.
See IMI installation and maintenance instructions.

MOTIVE FLUID: Steam, compressed air or other gases.

CE MARKING – GROUP 2 (PED – European Directive)	
PN16	Category
All sizes	2 (CE marked)

APPLICATION LIMITS	
Minimum density	0,80 kg/L
Maximum viscosity	5 °Engler
Maximum motive pressure	10 bar
Minimum motive pressure	0,5 bar
Pump discharge per cycle DN 25 to DN 50	16 L
Pump discharge per cycle DN 80 x 50	25 L

LIMITING CONDITIONS *

Stroke counter:

Available on request, it can be screwed directly into the top cover of the pump or above the pump through a 1/2" size pipe for easier reading (max. 1 m).

SIZING AND INSTALLATION

SIZING OF THE SYSTEM

The discharge capacity of the pump is a function of:

1. Condensate load (kg/h).
2. The pressure of operating medium (steam, compressed air or other gases).
3. The total lift or back pressure the pump will have to exhaust against. This includes the change in fluid level elevation after the pump (0.0981 bar/m of lift), plus pressure in the return piping, plus the pressure drop in bar caused by pipe friction, plus any other system component pressure drop the pump exhaust will have to overcome.
4. Filling head available (300 mm is recommended).

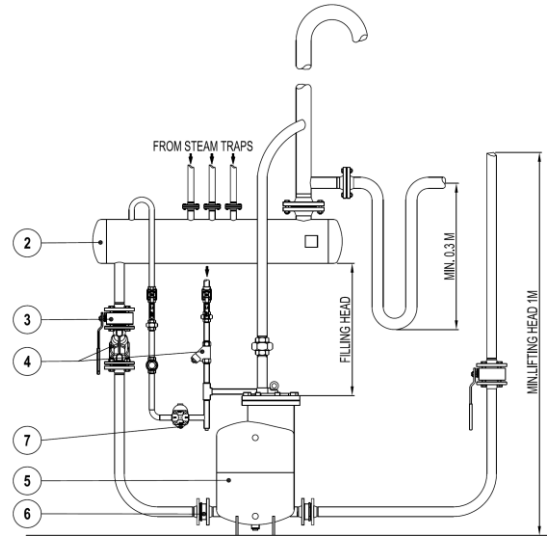

Fig. 1

INSTALLATION

Fig.1 shows a typical example of an ADCAMAT automatic pump installation. For further details and instructions please contact the distributor.

10		820	1490	2150	2360

Table 5 (based on liquid specific gravity 0,9 – 1,0).

Example:

Condensate load 1800 kg/h
 Filling head 150 mm
 Motive fluid Compressed air
 Available pressure 8 bar
 Vertical lift after pump 6 m
 Return piping pressure 1,5 bar
 Piping friction pressure drop Negligible

Calculations:

Total back pressure: 1,5 bar + (6 m x 0,0981) = 2,09 bar.
 Pump choice, assuming steam as motive fluid at a pressure of 8 bar and a back pressure of 3 bar, the DN 50 pump has a capacity of 2590 kg/h, according to Table 5.

Correction for filling Head:

With 150 mm filling head the correction factor from Table 4 is 0,7. The corrected capacity is 2590 kg/h x 0,7 = 1813 kg/h.

Correction for air as a motive fluid:

The % back pressure 2,09 bar / 8 bar = 30%
 The correction factor from table 3, is 1,08.
 The corrected capacity is 1813 kg/h x 1,08 = 195 kg/h, and so, a DN 50 pump is still recommended.

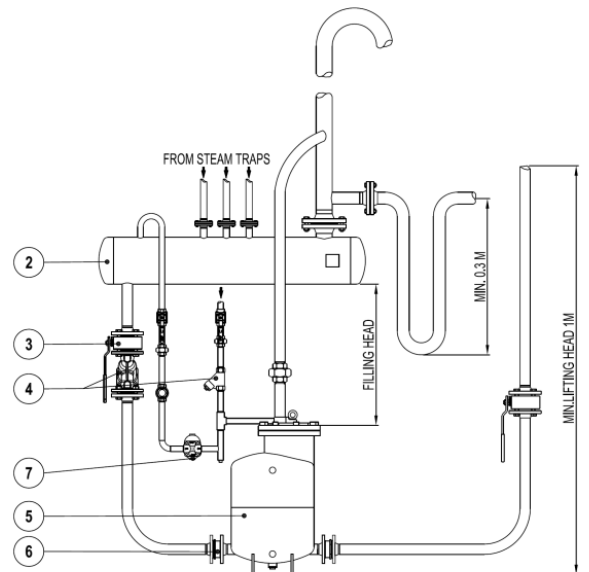

TYPICAL APPLICATIONS

Condensate recovery - open system

The pump removes high temperature condensate without cavitation problems.

WARNING: Vent line must be unrestricted and self draining to the receiver.

MATERIALS			
POS.	DESIGNATION	POS.	DESIGNATION
1	Heat exchanger	5	POPS pump
2	Receiver	6	RD40 disc check valve
3	Ball valve	7	Steam trap
4	Strainer	8	Air vent

Removal of condensate under pressure with POPS pump and steam trap combination

When the steam pressure is sufficient to overcome back pressure, the trap operates.

If the pressure decreases, then the pressure operated pump starts to work, removing the condensate by pumping through the float steam trap.

Drainage of a single unit under vacuum (max. 0,2 bar abs)

Head H1 must range between 1 and 2 m. The lift H must be as minimum as possible, but never less than 1 m (otherwise a siphon is required, as shown in H2).

Use steam as operating medium (max. pressure 2-3 bar).
